Explanation

Stuttgart has long been known as an automotive destination. This is at the core of our proposal for Villa Berg. Our vision for the villa berg is based on sustainable development supported through mobility and transport. A number of development precincts have been identified that have potential for increasing densities around existing and proposed mobility and transport nodes. Development precincts are of sufficient size to accommodate future development in a way that they would positively contribute to and compliment existing urban fabric in the suburb of villa berg. The proposed development precincts are able to achieve this through maintaining appropriate sight lines to the Villa Berg, adopting complimentary design elements, supporting local businesses and investment, or being suitably located so as to not compromise the existing development.

A major component to the proposal is the transport network, which our proposal relies on heavily. Through our investigation areas were identified with poor connections and, or substandard access to public transport. Keeping this in mind a focus on pedestrian, cycle and public transportation modes are necessary. Two links across the river are proposed, first a cable car linking an existing U-Bahn station with Mineral Bad via Villa Berg. This provides an alternative transportation mode, which is having increasing popularity in constrained cities. This option could be further supported through ongoing events at Wasen and the Mercedes Arena. The second proposed link is a multi-modal bridge. Its primary function would be to carrying a new U-Bahn line from Wasen grounds across the river through the riverside development precinct and continuing further south to rejoin existing U-Bahn lines to the south of villa berg.

The proposed design also introduced the idea of having a pedestrian path throughout the Neckar river this is in Parallel to the new proposed development to the waterfront area to be a high rise area which can contain office buildings, residential areas and commercial mall along the ground floor which will be served by the nice promenade created after diverting the existing high way to an underground tunnel

The development of this area is expected to bring a huge investment which will help to cover all the other expenses in addition to the huge change in Stuttgart skyline to match any other modern city in the world. This pedestrian promenade will be connected to the Wasen area with a living bridge which will give the chance to the public to enjoy and get closer to the river and also will be connected to the Berg park and villa with a nice landmark stairs to break the high barrier which is blocking and limiting the accessibility to the park and the villa

The concept proposed refurbishing and restoring the Villa to its original status but adding some minor modifications to enable the space to act as an international conference center which shall be connected and operated by an international hotel operator for a proposed new hotel instead of the current existing buildings which will encourage the touristic activities using the mineral baths which is also proposed to be developed to a 5 stars mineral bath and also the business activities and also giving the opportunity for the park to be utilized for some outdoor exhibition activities which can be sponsored by automotive companies for exhibition events and any other kind of events. The proposed concept also proposed some transportation hubs in some common places to enable the users to park their cars and use the alternative newly introduced sustainable, green and environmental means of transportation to sustain the concept of the sustainable mobility which is the main theme of the Project.

The proposed concept proposed some new medium residential areas which will enhance the social development of the district residence and also raise the financial value of the district

The concept also proposed removing the old City Dump Area and adding this area to the existing school as a future extension

Context

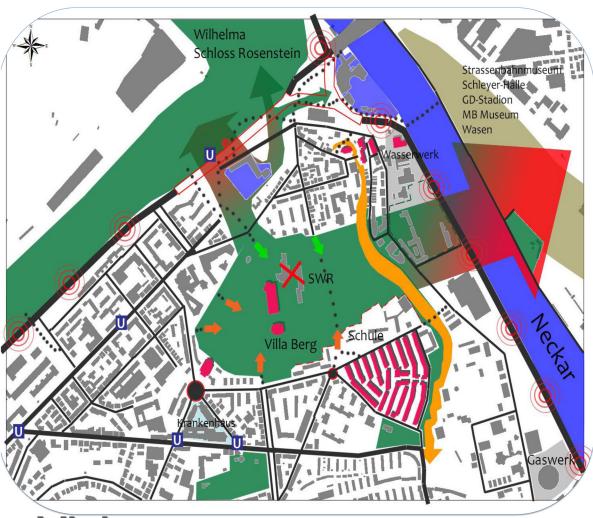

- L) Villa Berg
- d) Mineral Baths
- 3) Wasen Grounds
- l) Daimler Benz
- 6) Rosenstein Schloss
- Bad Cannstatt
- 7) Neckar River
- 8) Main Train Station9) City Centre
- 10) School
- 11) Hospital
- 12) Waserwerk
- 13) Schloss Garten

SWOT Analysis

Strengths

- Strong public ownership of parks
- Some large single land plots
- Located between Stuttgart centre and Bad Cannstatt

Good access to public transport

- along transport corridors
- Historically significant building
- Areas subject to ground water contamination identified

Opportunities

Weaknesses

- Area along the river poor access to public transport
- Water front access is restricted by motorway
- Fragmented real property ownership
- Groundwater remediation for contaminated sites
- No coordinated development strategy = ad-hoc development Lower socio0economic area

Threats

- Greater public access to waterfront area
- Increasing number of residential dwellings
- Comprehensive planning for the locality
- Promoting Stuttgart on a broader level
- Improving transport connections along the river front area
- Funding improvements through business investment
- Lack of community engagement and involvement
- · Ability to attract investment
- Lack of integration of brownfield sites
- · Erosion of original architectural

Vision

The vision for the villa berg is a transformation into the centre for mobility and transport in Germany, Europe and the world.

- Positioning Stuttgart as the epicentre for transport development in Europe.
 Growing Stuttgart into a destination for automotive and mobility activity.
- Creating new opportunities for businesses that value the historical and environmental attributes of Stuttgart and Berg.
- Adopting a sustainable approach to redevelopment of historical buildings and environmental resources.
- Achieving organic investment in the redevelopment in partnership with local businesses.
- Creating a balance between built environment and biodiversity values with minimal adverse environmental impacts.

Sustainability Objectives

1. Economic

Contributes to the generation of city economic wealth and employment; facilitates profitable and timely commercial development; provides development certainty for investment

2. Environmental

Development maintains or improves the quality of environmental resources; Balance between built environment and green space; Development responds to climate change through innovative design

3. Social

Building partnerships between local stakeholders and potential investors; Maximise accessibility and connectivity; Protection and restoration of history for public use
